AegisCV

AI-powered real-time loss prevention for fashion retail

Roermond, The Netherlands
Nikita Prasolov

PROBLEM: FASHION RETAIL VIEW

Shoplifting causes significant losses in fashion retail

Limited staff visibility → **Cameras only record** → **Loss discovered too late**

Limited staff visibility

- staff cannot monitor the entire store
- many stores lack dedicated security staff

Cameras only record

- store cameras are mainly used for recording
- suspicious actions are not detected in real time

Loss discovered too late

- theft is often discovered after the customer leaves
- losses are found during inventory checks

- In retail theft **"apparel, accessories, and footwear make up the majority of targeted goods at 41.7%"**
  Security Systems News / NRF retail crime data (2024) *https://www.securitysystemsnews.com/article/2024-ends-with-rising-trend-of-retail-crime*
  Fashion is one of the main retail categories targeted by shoplifters.

- **"Retailers are losing around €4 million a year in compensation from shoplifters who they are unable to identify."**
  DutchNews (2025) *https://www.dutchnews.nl/2025/01/police-failure-to-share-shoplifters-details-costs-retailers-e4m/*
  In the Netherlands, shoplifting is already causing measurable financial losses.

Fashion retail is a high-risk theft category with measurable financial impact.

PROBLEM: TECHNICAL VIEW

Existing systems are not reliable in fashion retail environments

Research

- Fashion CV still faces **data scarcity, computational constraints, privacy concerns, and algorithmic bias**
  Computer Vision for Fashion: A Systematic Review (2025) https://www.mdpi.com/2078-2489/17/1/11
  Clothing is hard to analyse in stores because garments overlap, change shape, and are often partially hidden by racks or other items.

- Retail vision systems also face **occlusion, theft prevention, and real-time processing** challenges.
  A Survey of Challenges and Sensing Technologies in Autonomous Retail Systems (2025) https://arxiv.org/abs/2503.07997
  Fashion stores are visually crowded, so it is harder for AI to track people, items, and suspicious interactions accurately in real time.

  AI in fashion is still difficult to deploy reliably in real time.

Industry

- Fashion and luxury companies are using gen AI only **"in select functions for routine tasks."**
  The State of Fashion 2026 (McKinsey × BoF) https://www.mckinsey.com/industries/retail/our-insights/state-of-fashion
  This suggests that AI in fashion is still mostly used in limited, lower-risk workflows, rather than in difficult live store operations such as theft prevention

- In loss prevention, accuracy must be "**extremely high … to prevent false positives.**"
  The future of 'shrink': the increase of shoplifting (Deloitte, 2024) https://www.deloitte.com/uk/en/Industries/consumer/blogs/the-future-of-shrink-the-increase-of-shoplifting.html
  In fashion stores, many normal customer actions can look suspicious, which makes false alerts a major problem.

  AI in fashion is not yet mature for complex in-store operations.

Current limitations leave fashion retail without a reliable real-time AI theft prevention solution.

SOLUTION: TECHNICAL VIEW

Built specifically for real fashion retail environments

- **Proprietary algorithms for soft and deformable objects**
  We have deep expertise in visual processing of soft and deformable objects, and we have developed proprietary algorithms specifically designed for the complexity of fashion retail.

- **Context-aware event analysis**
  Our system combines multiple AI models to analyse movement, object interactions, and surrounding context in real time, instead of relying on a single isolated gesture model.

- **Adaptive false-positive reduction**
  After an initial suspicious-event detection, the system applies our algorithms and filtering methods to increase or decrease event confidence, with detection thresholds calibrated to each store's requirements.

- **Extensible detection architecture**
  The system is designed to support new algorithms, filters, and behavioural rules over time, enabling adaptation to new theft methods as they emerge.

- **Store-specific fine-tuning**
  Our system is fine-tuned during a pilot period for each store's specific layout, camera angles, customer flow, and operational patterns.

Our innovation is a context-aware, store-adapted AI system that combines proprietary algorithms for soft and deformable objects with adaptive detection logic to enable real-time theft prevention in fashion retail.

SOLUTION: FASHION RETAIL VIEW

AegisCV helps fashion stores detect suspicious actions in real time

Full store visibility → **Real-time alerts** → **Prevent loss**

Full store visibility

- the system analyses store activity in real time
- staff can focus on assisting customers

Real-time alerts

- suspicious actions trigger an instant alert
- short video clips can be reviewed immediately

Prevent loss

- staff can respond immediately to suspicious situations
- losses can be prevented before exit

Operational value

- fewer missed incidents
- quicker staff intervention
- staff more focus on sales

AegisCV turns store cameras into a real-time loss-prevention tool for fashion retail.

PROTOTYPE

AegisCV runs locally and connects to existing store cameras

- **In-store processing**

  A small in-store server connects to existing cameras and analyses store activity in real time.
  The system is configured for each store environment to ensure reliable detection.

  All processing happens locally in the store. Video data is stored only for a short time.
  No facial recognition or personal identification.

- **Staff notification anywhere in the store**

  Store staff receive alerts on a tablet or smartphone connected via Wi-Fi.
  Staff can quickly review what happened and decide how to respond.

A working prototype is currently being tested in real fashion store scenarios.

MARKET

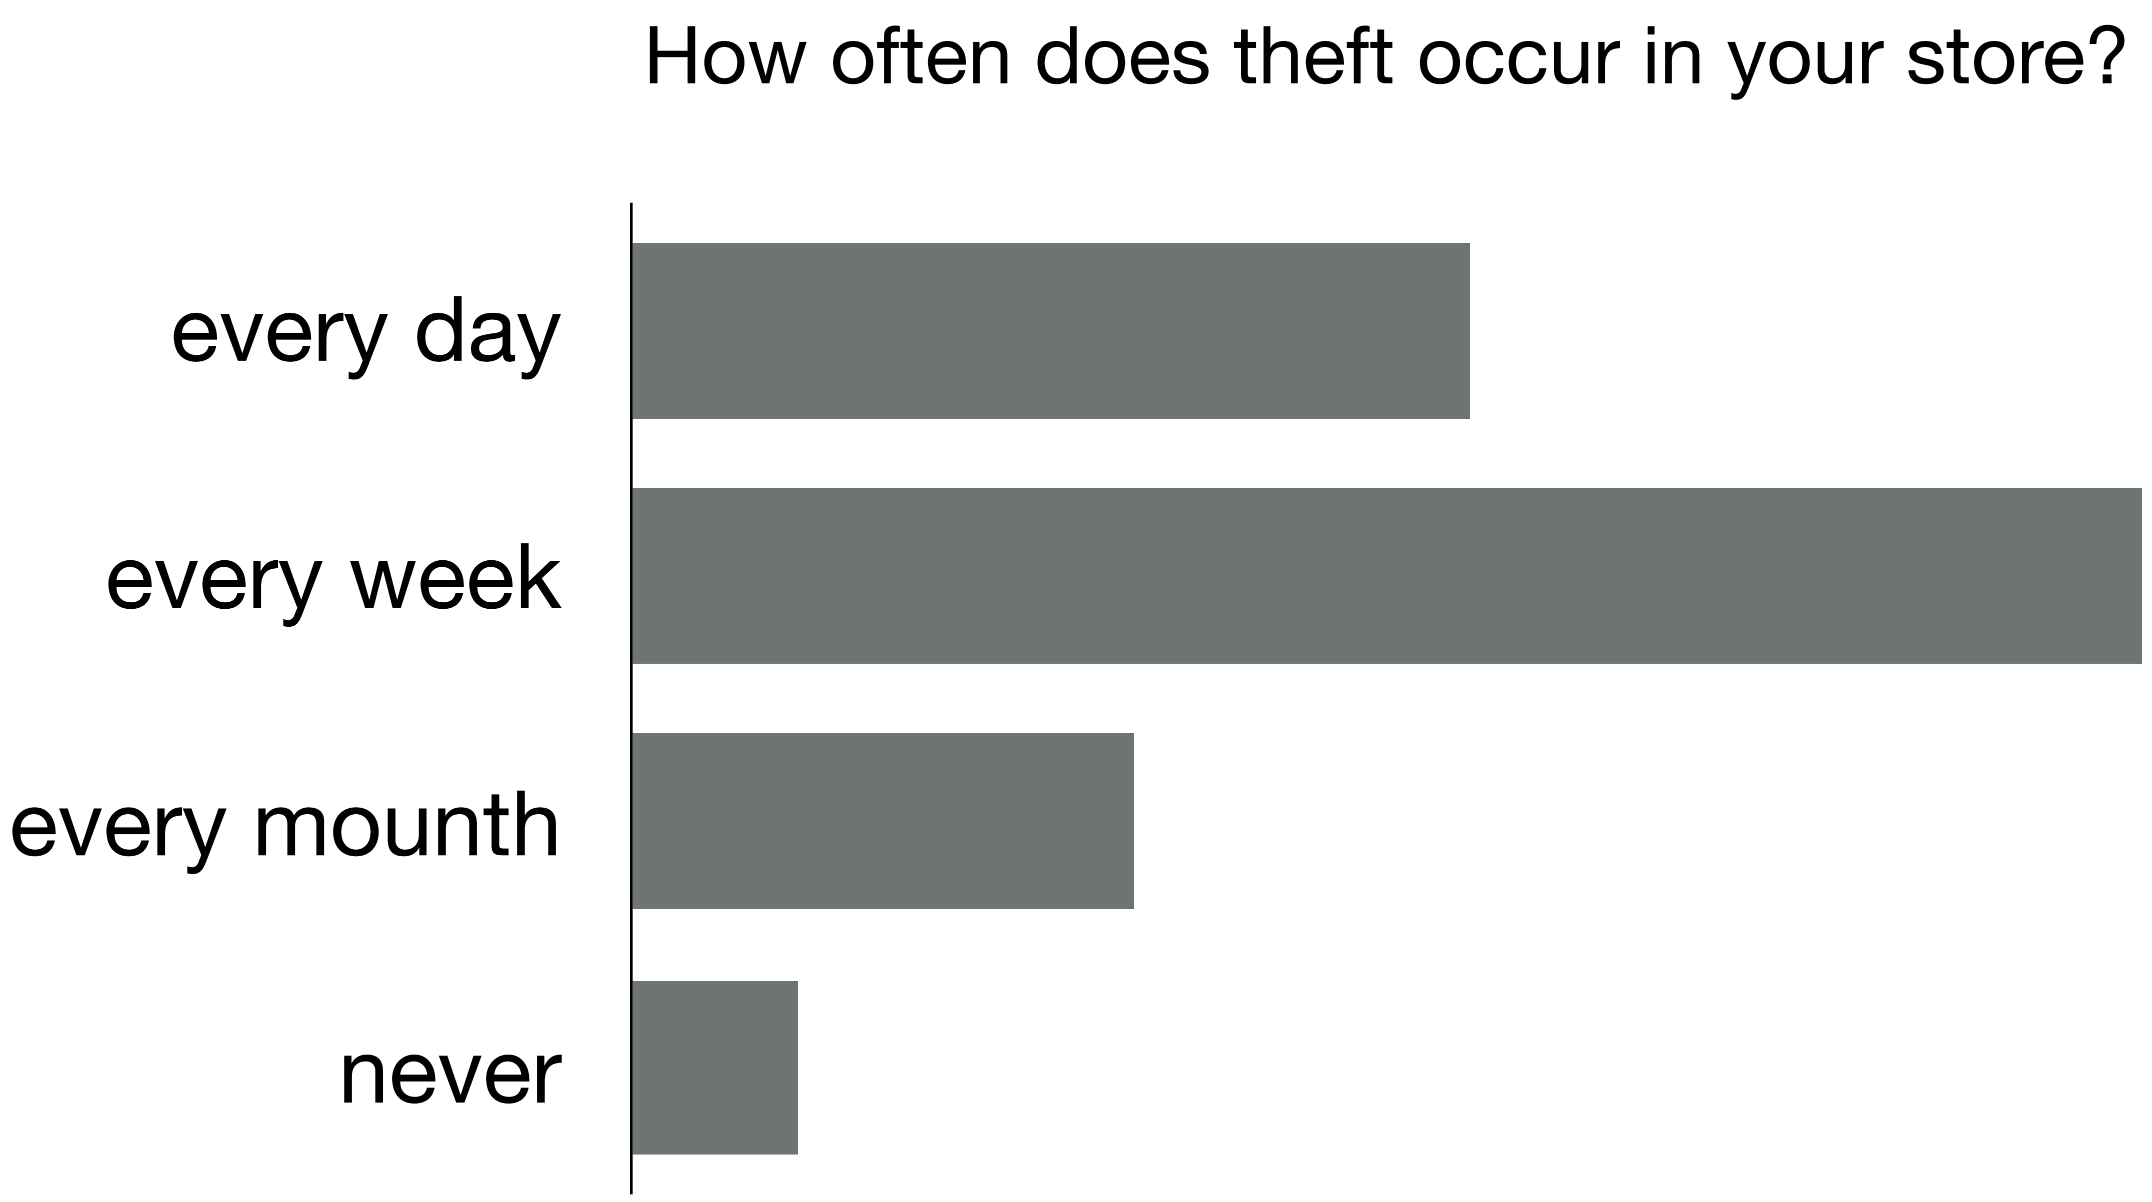
Existing retail AI solutions are built for other retail formats

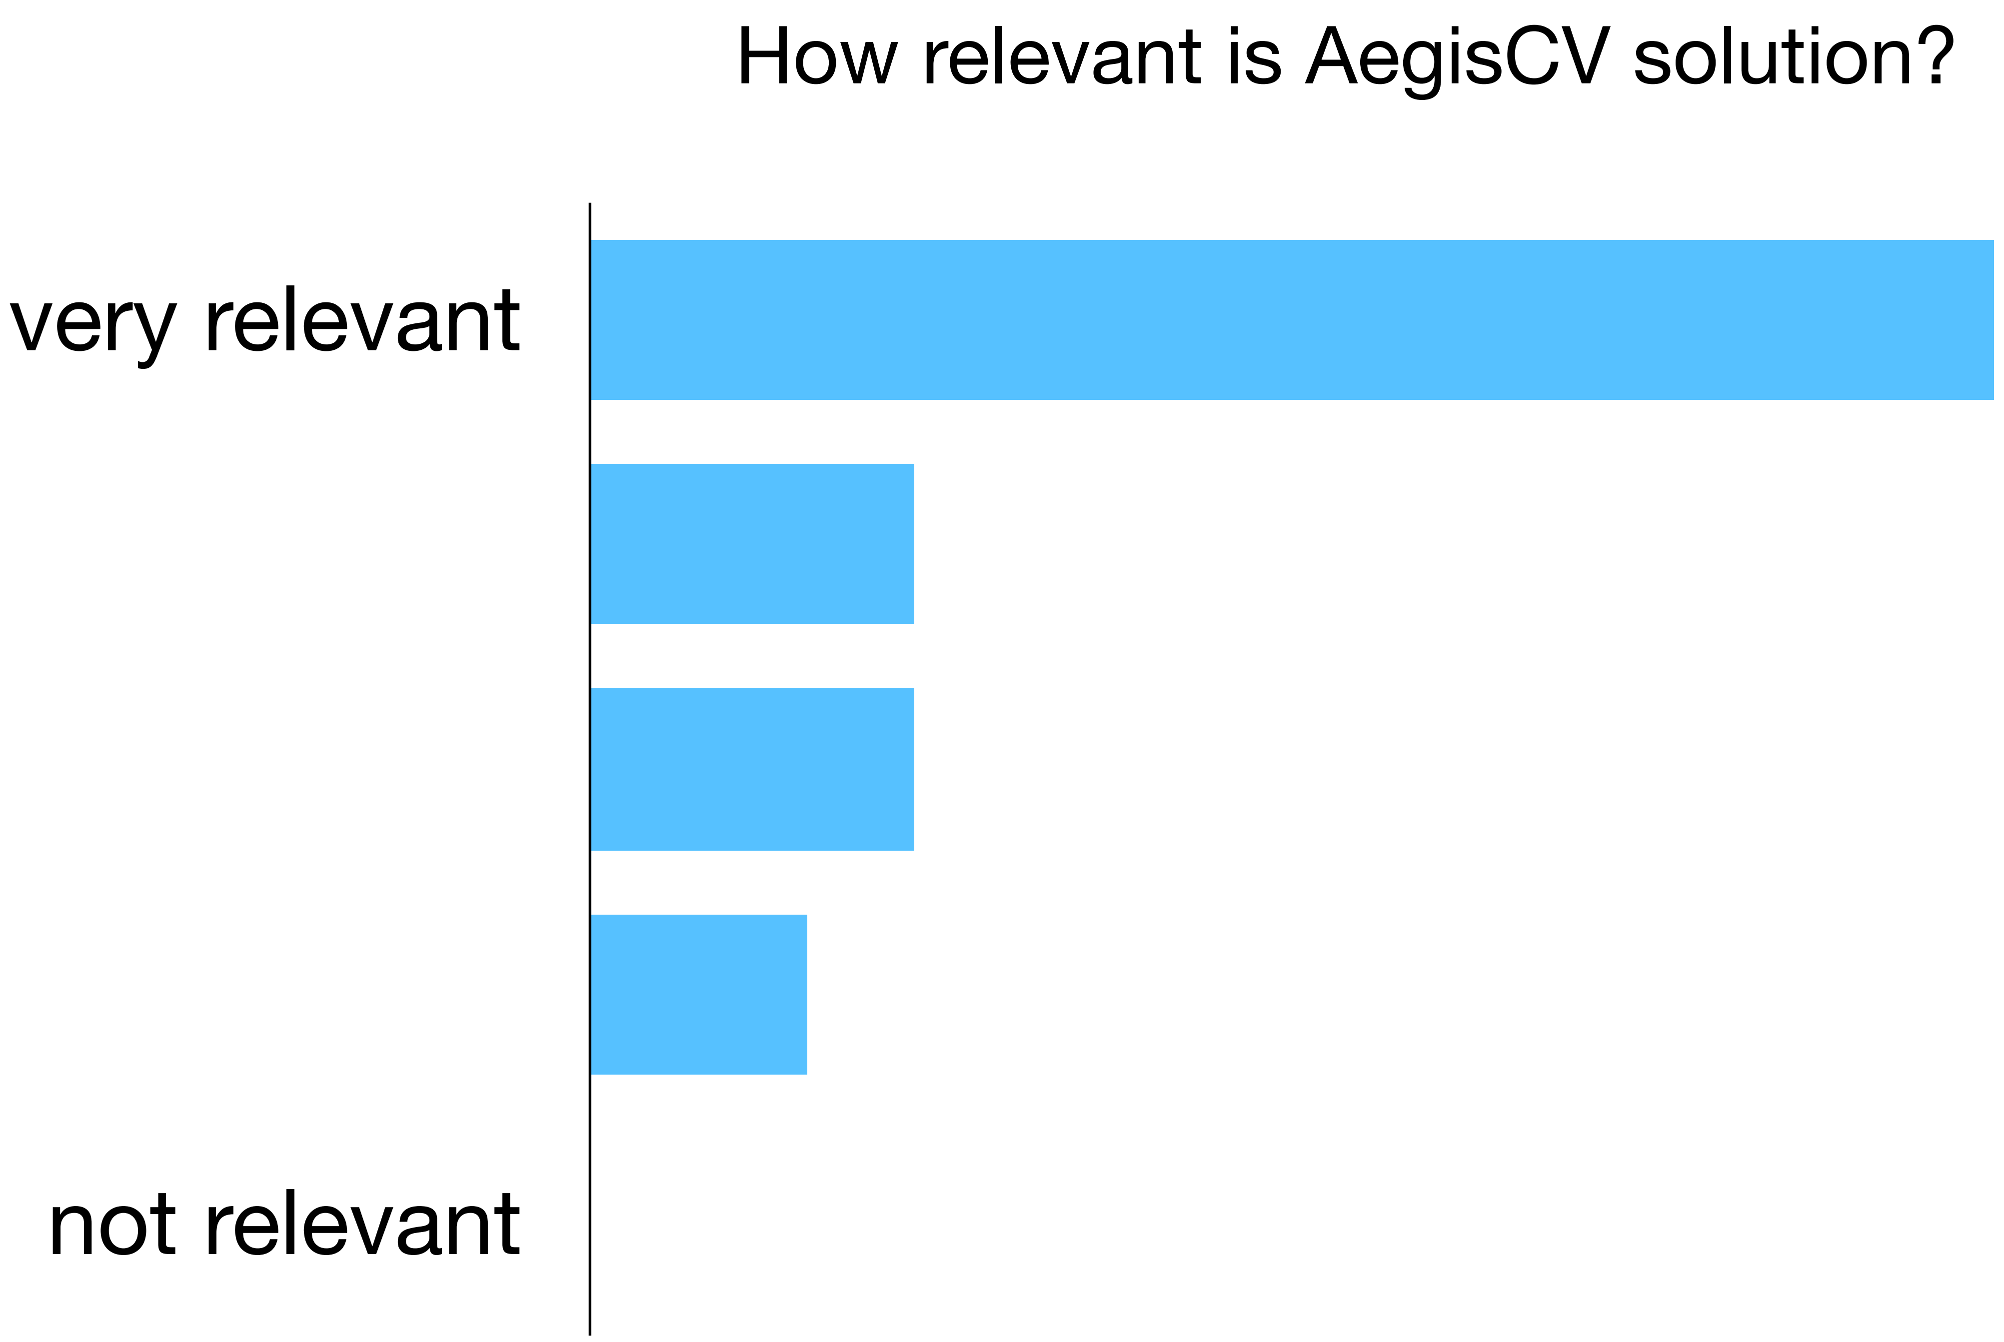
	AegisCV	Veesion	Trigo	Traditional CCTV
Designed for fashion retail	✔	✖	✖	✖
Context-aware analysis	✔	✖	partial	✖
Easy deployment for single stores	✔	partial	partial	✔
Real-time behavior detection	✔	✔	✔	✖
Privacy-friendly (no facial recognition)	✔	✔	✔	✖

AegisCV analyses behaviour in context to support store staff in fashion retail environments.

CUSTOMER VALIDATION

Fashion retail staff confirm the problem and interest in the solution





- **25 interviews with store managers and shop assistants**
- **most stores report regular concealment incidents**
- **none of the retailers interviewed reported knowing of a comparable solution for fashion stores**

BUSINESS MODEL

Pilot-to-subscription model

Entry → Conversion → Revenue

Entry

- one-month pilot in a fashion store
- camera integration and store-specific setup
- low-friction entry for early customers

Conversion

- detect real suspicious behaviour
- validate operational value with store staff
- prove ROI before full rollout

Revenue

- one-time setup fee
- monthly subscription
- pricing scales with camera count

Customers start with a pilot, validate value in-store, and convert to a recurring subscription.

ROADMAP

From MVP to first paid pilots

- **Q1:** finalise MVP, prepare pilot hardware, improve detection accuracy
- **Q2:** deploy first pilot, fine-tune for store conditions, validate staff workflow
- **Q3:** collect pilot data, improve performance, expand detection scenarios
- **Q4:** run 2–3 pilots, prove value, convert pilot stores into paying customers

Expand the technical and commercial team as pilot deployments progress

FOUNDER

20+ years of experience in software development and product launches

- Founder (3 months) - AegisCV
  Building a context-aware prototype for real-time theft prevention in fashion retail.
  Focused on pilot preparation and team building.

- Founder & CEO (5+ years) - MeatyMade
  Developed a cross-platform mobile graphics engine and a free-form origami simulation engine.
  Built deep expertise in visual processing and algorithms for soft and deformable objects.

- CTO & Co-founder (2 years) - Platformaly (a subsidiary of Bercut Ltd)
  Built integration platforms connecting large retailers, banks and mobile operators.
  Gained hands-on experience in retail workflows, technical sales and AI/ML-related solutions.

- Head of Architecture Department - (7+ years) Bercut Ltd
  Designed and led large-scale enterprise solutions for mobile operators.
  Worked on scalable, high-load, and reliable real-time systems.

- IT Architect (10+ years) - Bercut Ltd
  Worked on new-technology software projects in the mobile operator sector.
  Built a strong foundation in software architecture and complex systems design

WHY THE NETHERLANDS

The Netherlands is a strong starting point for piloting AI solutions in fashion retail

- Roermond is home to Designer Outlet Roermond, one of Europe’s largest outlet centres (200+ stores)
- based near the Roermond outlet area, giving direct exposure to fashion retail operations and local pilot opportunities
- strong CCTV adoption and developed retail infrastructure support fast deployment in stores
- strict privacy regulations favour privacy-friendly AI approaches
- the compact Dutch market enables fast pilot validation and iteration cycles
